FINDINGS

- 1. Month 1-2 is the cliff. Avg churn in M1-M2 is ~3%, vs ~3% steady-state monthly churn from M6 onward.
- 2. NPS is the dominant early-churn signal. Month-2 churners: 73% detractors vs 25% for retained subscribers — 3.0x higher detractor rate.
- 3. Logistic regression flags 28% of base 30 days ahead at 78% precision (recall 67%, AUC 0.84). Top drivers: NPS, payment failures, swap requests.
- 4. Referral & Direct channels deliver ~6% higher 12-mo LTV than Meta Ads, a clear acquisition-mix re-allocation opportunity.

RECOMMENDATIONS (tied to Customer-Monetization charter)

- Month-2 Save Plan: proactive loyalty credit + free Swap for at-risk subs flagged at day 30. Targets the NPS cliff; mirrors the existing Swap/Relocation play, applied earlier in tenure.
- Onboarding intervention: prioritise delivery SLA in Delhi/Hyderabad (3+ day delay → +0.7 NPS hit).
- Channel mix: shift 10-15% of paid spend from Meta into Referral (LTV uplift ~25%, lower CAC).
- Score & route weekly: feed model scores into the retention CRM; weekly cohort scorecard reviewed by Strategy + CRM + Ops with named owners on intervention completion rate.

METHOD (so the numbers above are defensible)

- Data: 12,000 records, 12 monthly cohorts, 6 cities, 5 channels, 6 categories.
- Retention: per-cohort survival from acquisition month, observed through May 2026.
- LTV: cumulative ARPU × retention, 18-month horizon, ARPU = INR 2,060/mo.
- Churn model: scikit-learn LogisticRegression, balanced class weights, threshold tuned on PR curve for the ~78% precision operating point.
